

The *textalpha* package

Günter Milde

2020/10/30

Abstract

The *textalpha* package enables the use of Greek characters in text independent of font encoding or TeX engine.¹ Input is possible via text commands (`\textalpha ... \textOmega`) or Unicode literals².

to get a unified interface for Greek letters and symbols that works in all text font encodings, with both, Unicode fonts and the *fontspec* package or 8-bit fonts and the *fontenc* package.

See the source of this document `textalpha-doc.tex` for a setup and usage example, the literate source of the package `textalpha.sty` for the implementation, and `test-tuenc-greek.pdf` for Greek with XeTeX/LuaTeX.

1.1 Options

1.1.1 `normalize-symbols`

Mathematical notation uses variant shapes of some Greek letters as additional symbols. There are separate code points for the symbol variants in Unicode. TeX supports some of the variant shape symbols in mathematical mode ($\theta|\vartheta, \phi|\varphi, \pi|\varpi, \rho|\varrho, \epsilon|\varepsilon$) but not in the LGR font encoding used for Greek text in 8-bit TeX. The variations have no syntactic meaning in Greek text and text fonts may use the variant shapes in place of the “regular” ones as a stylistic choice.

The `normalize-symbols` option merges letters and symbols to Greek letters. This way, text copied from external sources can be compiled without errors even if it contains a GREEK SYMBOL ... in place of a GREEK LETTER ...:

The source of this paragraph uses both variants for beta ($\beta|\beta$), theta ($\vartheta|\theta$), phi ($\varphi|\phi$), pi ($\pi|\pi$), kappa ($\kappa|\kappa$), rho ($\rho|\rho$), Theta ($\Theta|\Theta$), and epsilon ($\varepsilon|\epsilon$).

This option is ignored with Unicode fonts.

Attention: Do not use this option in cases where the distinction between the symbol variants may be important (e.g. in a mathematical or scientific context). Try the `alphabetalpha` package with the respective characters in mathematical mode or use XeTeX/LuaTeX with Unicode fonts in these cases.

1.1.2 `keep-semicolon`

LGR is no *standard text font encoding*. Latin characters and some other ASCII symbols are mapped to Greek “equivalents” if LGR is the active font encoding. (See `usage.pdf` for a description of this Latin-Greek transliteration.)

Special care is required with the question mark characters: The LGR font encoding uses the Latin question mark as input for the *erotimatiko* and maps the semicolon to a middle dot (*ano teleia*). As a result, Unicode-encoded texts that use the semicolon as *erotimatiko* end up with an *ano teleia* in its place! Without special care, only the deprecated character 037E GREEK QUESTION MARK³ works with both, Xe/LuaTeX and 8-bit TeX.

The `\textsemicolon` command inserts an *erotimatiko* in LGR and a semicolon else (i.e. always a character that looks like a semicolon):

³The Unicode standard provides the code point 037E GREEK QUESTION MARK but says character 003B SEMICOLON and not 037E is the preferred character for a ‘Greek question mark’ (*erotimatiko*).

With the `keep-semicolon` option, character 003B SEMICOLON can be used for the *erotimatiko* also with LGR encoded fonts:

This option is ignored with Unicode fonts (where the SEMICOLON literal always prints a semicolon character).

If compiling with 8-bit TeX, the internal font encoding switches interfere with other work behind the scenes. Kerning, diacritics and up/down-casing show problems if Greek letters are used without explicit change of the font encoding.

2.1 Kerning

Compiling with LuaTeX provides kerning also on font encoding boundaries.

Accent macros do not work with Unicode literals as base character under 8-bit TeX engines. Use the Latin transliteration or LICR commands.

With LGR and TU, pre-composed glyphs are chosen if available. In other font encodings, accent macros do not select pre-composed characters. The difference is a sub-optimal placement of the accent and becomes obvious if you drag-and-drop text from the PDF version of this document.:

Greek diacritics (except the dialytika) are placed before capital letters in Titlecase and dropped in UPPERCASE:

With the new `\MakeUppercase` implementation (since 2022/06), Greek upcasing rules are only applied if the text language is set to Greek with Babel (and still need some fixes for LICR input).

3

	LICR	Unicode
LGR	‘A	‘A
T1	Á	‘A

With the old implementation of `\MakeUppercase`, the auto-hiatus feature works with L^AT_EX commands, not Unicode literals. The new implementation works with Unicode literals but only if the text language is Greek (i.e. not in this document that does not load Babel).

$\alpha\upsilon\pi\iota\alpha \mapsto \mathsf{A}\check{\Upsilon}\mathsf{I}\mathsf{I}\mathsf{N}\mathsf{I}\mathsf{A}$ (OK)
 $\alpha\upsilon\pi\iota\alpha \mapsto \mathsf{A}\check{\Upsilon}\mathsf{I}\mathsf{I}\mathsf{N}\mathsf{I}\mathsf{A}$ (OK with LGR)
 $\alpha\upsilon\pi\iota\alpha \mapsto \mathsf{A}\Upsilon\mathsf{I}\mathsf{I}\mathsf{N}\mathsf{I}\mathsf{A}$ (literal characters fail without Babel)

3.1 Greek alphabet

$\alpha \beta \gamma \delta \epsilon \zeta \eta \theta \iota \kappa \lambda \mu \nu \xi \omicron \pi \rho \sigma \tau \upsilon \varphi \chi \psi \omega$
 $\mathbf{A B \Gamma \Delta E Z H \Theta I K \Lambda M N \Xi O P \Pi \Sigma T \Upsilon \Phi X \Psi \Omega}$
 Greek letters via default macros in the font for Latin script (here T1):
 $\alpha \beta \gamma \delta \epsilon \zeta \eta \theta \iota \kappa \lambda \mu \nu \xi \omicron \pi \rho \sigma \tau \upsilon \varphi \chi \psi \omega$
 $\mathbf{A B \Gamma \Delta E Z H \Theta I K \Lambda M N \Xi O P \Pi \Sigma T \Upsilon \Phi X \Psi \Omega}$

Diacritics
 Symbol macros:⁵ $\alpha \beta \gamma \delta \epsilon \zeta \eta \theta \iota \kappa \lambda \mu \nu \xi \omicron \pi \rho \sigma \tau \upsilon \phi \chi \psi \omega$
 Named macros: $\alpha \beta \gamma \delta \epsilon \zeta \eta \theta \iota \kappa \lambda \mu \nu \xi \omicron \pi \rho \sigma \tau \upsilon \phi \chi \psi \omega$ Only in LGR: $\alpha \beta \gamma \delta \epsilon \zeta \eta \theta \iota \kappa \lambda \mu \nu \xi \omicron \pi \rho \sigma \tau \upsilon \phi \chi \psi \omega$

COL1	COL2	COL3	COL4
COL1		COL3	
Viele	Grüße	$\dot{\alpha}$	$\dot{\omega}$

The lower Sigma comes in two variants: `\textsigma` σ is used inside a word and `\textfinalsigma` ς (or `\textvarsigma` ς) at the end of words.

4

	0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F
370	◦	◦	◦	◦	’	’	◦	◦			’	◦	◦	◦	;	
380					’	’	’A	’	’E	’H	’I		’O		’Υ	’Ω
390	ι	A	B	Γ	Δ	E	Z	H	Θ	I	K	Λ	M	N	Ξ	O
3A0	Π	P		Σ	T	Υ	Φ	X	Ψ	Ω	Ϊ	Ϋ	ά	έ	ή	ί

Table 1: Greek and Coptic Unicode Block, input as literal Unicode characters in T1 font encoding (legend: ◦ glyph missing in LGR).

In LGR, the Latin letter `s` and the command `\textautosigma` print the “normal” sigma if followed by another letter and the final sigma if followed by space or punctuation. This is implemented via the font ligature mechanism and works only in LGR: $\sigma\varsigma$ (LGR) vs. $\varsigma\varsigma$ (T1).

The upper case of both sigma variants is `\textSigma`, the lower case of Sigma is `\textautosigma`.

Test: (Unicode literal and `\text...` commands in LGR)

original: $\sigma\varsigma\varsigma\varsigma\varsigma\Sigma\Sigma$

MakeUppercase: $\Sigma\Sigma\Sigma\Sigma\Sigma\Sigma\Sigma$

MakeLowercase: $\sigma\varsigma\varsigma\varsigma\varsigma\sigma\varsigma$

TODO: With the new MakeLowercase, a literal Σ is converted according to its position :) but the macro `\textSigma` is converted to a final sigma also in the middle of a word (at least with language English).

3.2 Greek Unicode characters in non-Greek text

With the *textalpha* package, *greek-inputenc* and input encoding `utf8`, Greek Unicode characters can be used in text with any font encoding. See Tables 1 and 2.

Kerning is preserved if the active font encoding supports Greek: ΑΨΑ

Combined Diacritics work ξ̂, diacritics (except diaeresis) are dropped with MakeUppercase ($\mu\acute{\alpha}\iota\sigma\tau\rho\omicron\varsigma \mapsto \text{ΜΑΪΣΤΡΟ}\Sigma$).

3.3 PDF strings

With *textalpha* and *greek-inputenc*, there are two options to get Greek letters in PDF strings: LICR macros and literal Unicode input.

3.3.1 λογος, λογος and λογος

The subsection title above uses: LICR macros, Unicode input and the LGR transliteration for the Greek word *λογος*. Check the table of contents
